The data and maps may not be used to determine title, ownership, legal descriptions or boundaries, legal jurisdiction, or restrictions that may be in place on either public or private land. Natural hazards may or may not be depicted on the data and maps, and land users should exercise due caution. The data are dynamic and may change over time. The user is responsible to verify the limitations of the geospatial data and to use the data accordingly.

Soil Burn Severity	Acres
High	173
Moderate	1,262
Low	7,468
Unburned	2,560
Total	11,463

- Fire Perimeter - Sept. 28, 2018
- National Forest Boundary
- Other Land, Including Private
- Road - Operational Maintenance Level
- 5 - High Degree of User Comfort
- 4 - Moderate Degree of User Comfort
- 3 - Suitable for Passenger Cars
- 2 - High Clearance Vehicles
- 1 - Basic Custodial Care (Closed)
- Non FS Road

Soil Burn Severity

High soil burn severity
 All or nearly all of the pre-fire ground cover and surface organic matter is lost, and the soil is severely scorched, and charred, and the surface is very rough. Soil is often gray, orange, or reddish, and the ground surface where large trees were concentrated is charred.

Moderate soil burn severity
 Up to 10 percent of the pre-fire ground cover (leaves and ground cover) may be consumed, but generally less than 10 percent. There may be patches of bare, reddish-brown ground, and the canopy and understory vegetation will likely appear scorched.

Low soil burn severity
 The ground surface, including any exposed mineral soil, may appear slightly charred, and the canopy and understory vegetation will likely appear "green."

Very Low or Unburned
 Little to no fire impact is evident. The canopy and ground cover are completely intact. Little to no vegetation mortality is evident.

For more information on soil burn severity, visit the National Fire Protection Association's www.nfpa.gov website.
